# TAISEI Low Fin Tube

~For best heat exchanger~

## TAISEI Low Fin Tube

SUS304 (φ12.7)  
STB340 (φ12.7)  
C7060T (φ12.7)  
C6872T (φ12.7)  
C1220T (φ12.7)  
C1220T (φ9)

A heat exchanger using low fin tubes is known to show high-performance in heat transmission of water and oil. Its fins produce a large heat transmission surface.

Furthermore, Taisei pursued the best performance and succeeded in producing "Taisei Low Fin Tube" which has the smallest tube diameter and the largest number of fins in the heat exchanger industry.

That is the reason for Taisei heat exchanger's incomparable high-performance and compact design. We proudly claim that our Taisei's heat exchanger is a top quality product.

### Internal production

TAISEI developed a rolling machine to create high-quality low fin tubes.

### Smallest diameter for heat exchanger (φ9~)

The smallest diameter tube increases the coefficient of heat transmission and more tubes can be installed in shell. This results in cooling surfaces larger than other equivalent heat exchangers.

### The largest number of fins in the heat exchanger industry (28 fins / inch)

More fins are available, therefore producing larger cooling surfaces.

### Various types of fin tubes

As the picture shows, we have various materials and sizes of low fin tubes.  
(φ9, φ12.7, φ15.88)

### Compact and high performance

### cost performance

### Flexibility

### The top quality heat exchanger

**Top sales in the Japanese market**  
(shell & tube type)

## ■ Select oil cooler

- Select the type, model and size of cooler based on heat exchanged volume shown in graph.
- Contact Taisei and/or a distributor if your application is not covered by the selection graph. Enter your specifications on the form "Request For Quotation" and fax it to Taisei and/or your distributor. The best cooler will then be recommended.

The following is an example for selecting cooler where the oil viscosity and oil temperature are similar to the graph on the following page.

**Step 1:** Complete the equation of heat exchanged volume

$$Q = W_o \times 60 \times \rho_o \times C_o \times (T_1 - T_2) \quad \text{Reference the form RFQ for abbreviations.}$$

$$= W_w \times 60 \times \rho_w \times C_w \times (t_2 - t_1) \quad \rho: \text{Specific Gravity} \quad C: \text{Specific Heat}$$

**Step 2:** Calculate mean temperature difference

$$\theta = \frac{(T_1 - t_2) - (T_2 - t_1)}{2.3 \log \frac{(T_1 - t_2)}{(T_2 - t_1)}} \quad \text{Where } \theta \text{ is the logarithm mean temperature difference (}^\circ\text{C)}.$$

**Step 3:** Obtain estimated surface cooling area

$$A = \frac{Q}{\theta \cdot K} \quad \text{Where K is the overall heat transfer coefficient (kcal/m}^2\text{h }^\circ\text{C)}$$

$$\text{Where A is the surface cooling area (m}^2\text{)}$$

K value depends upon operating conditions and construction of the cooler but the following average values can be used

Tube Diameter	K value
9 mm dia. low fin tube	350~450
12.7 mm dia. low fin tube	200~250

**Step 4:** Selecting a cooler model

Select a standard model number which has the closest surface cooling area (A) matching your application needs.

Determine surface cooling area of FCF, FCD, FCX, FCW, FCU and FPD models using the example below:

Example: For Model FCF-234, divide the last two digits by 20. For FCF-311 and above models and FPD models, divide the last two digits by 2.

$$A = 34 / 20 = 1.7 \text{m}^2$$

**Step 5:** Determine the best number of baffles.

Using the selection graph for coolers, choose the number of baffle sets (0, 1 and 2).

**Step 6:** Confirm the cooler selected matches all specifications.

Based on the cooler selected in step 5, obtain (K) with reverse calculations of step 1 through 3.

If calculated K value is close to the average K value, the cooler selection is correct.

If it is too far from the average, select another model and confirm all specifications mentioned here.

## ■ Heat transfer Tube Material

Low Fin Tube  $\phi$  9mm and  $\phi$  12.7mm

JIS Code	Description
C 1 2 2 0 T	Phosphorus Deoxidized Copper Tube
C 1 0 2 0 T	Oxygen-free Copper Tube
C7060T-0	90-10 Copper Nickel Tube
C7150T-0	70-30 Copper Nickel Tube
C6872T-0	Aluminum-Brass
S T B 3 4 0	Carbon Steel Boiler and Heat Exchanger Tube
SUS304TP	304 Stainless-steel Tube (12.7 mm dia.)
SUS316TP	316 Stainless-steel Tube (12.7 mm dia.)

## ■ Coolant Water Quality

Use coolant water that meets the specifications listed below:

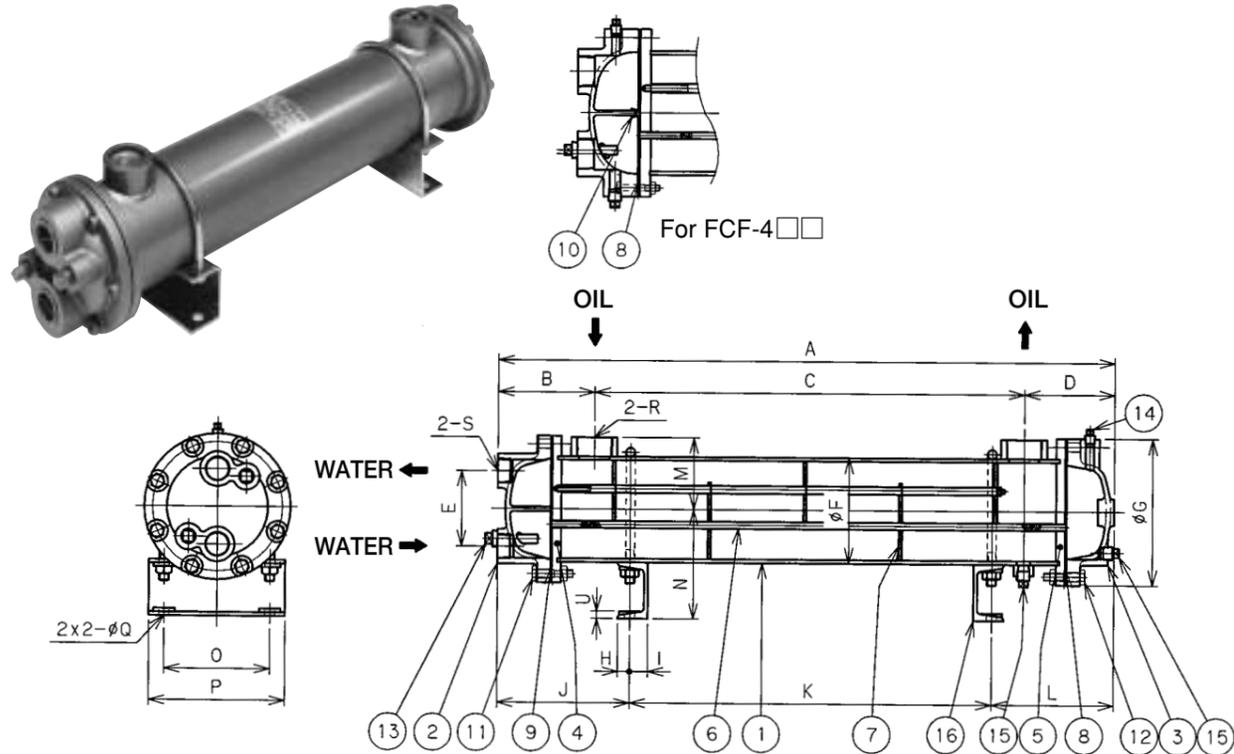

### Coolant Water Specifications per JRA-GL-02-1994

Item	Standard Value	Tendency		
		Corrosion	Scale	
Standard Items	pH [25°C]	6.5~8.2	○	○
	Conductivity [25°C] ( $\mu$ S/cm)	800 and below	○	○
	Iron Chloride (C l <sup>-</sup> /l)	200 and below	○	
	Iron Sulfate SO <sub>4</sub> <sup>2-</sup> (mgSO <sub>4</sub> <sup>2-</sup> /l)	200 and below	○	
	Acid Consumption [pH4.8] (mgCaCO <sub>3</sub> /l)	100 and below		○
	Hardness (mgCaCO <sub>3</sub> /l)	200 and below		○
Ref Items	Fe (mgFe/l)	1.0 and below	○	○
	Iron Sulfide S <sup>2-</sup> (mgS <sup>2-</sup> /l)	Not detected	○	
	Iron Ammonium NH <sub>4</sub> <sup>+</sup> (mgNH <sub>4</sub> <sup>+</sup> /l)	1.0 and below	○	
	Ionic Silica SiO <sub>2</sub> (mgSiO <sub>2</sub> /l)	50 and below		○

Notes:

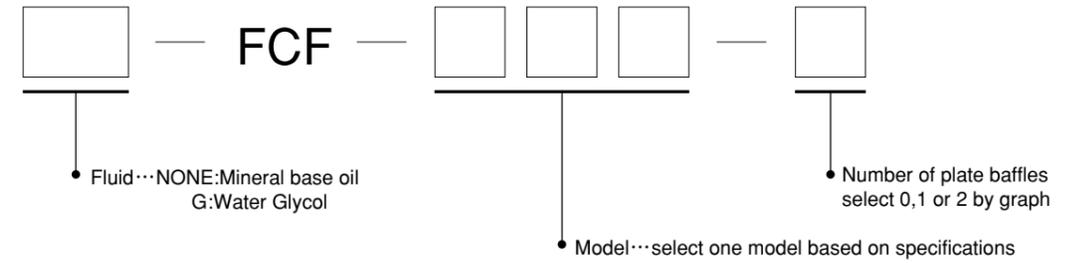

1. Use city tap water, deep-well water and industrial water as coolant water. Untreated river water, pond water and lake water could be contaminated.
2. These standard values are meant to extend cooler life and maintain cooler performance, but even if all values are within limit, corrosion may still occur.

## Model Number

## Specifications

Type	Shell & tube, Floating tube plate
Max.operating Pressure	Shell Side : 1.0MPa / Tube Side : 1.0 MPa
Fluids	Sell side : Mineral based oil, Water Glycol and Phosphate Ester etc. Tube side : Fresh water / sea water
Tube material	9mm dia. Low Fin Tube
Cooling area	0.4~5.5m <sup>2</sup>
Features	Space: Unique low fin tubes allows 20% size and weight reduction.
	Leg: U bolt type legs allow free installation
	Corrosion Proof: Inside of water chamber covers are coated with a tar-epoxy paint to prevent corrosion

## Component Parts

No.	Parts name	No.	Parts name

## ► Cooler selection graph

Condition

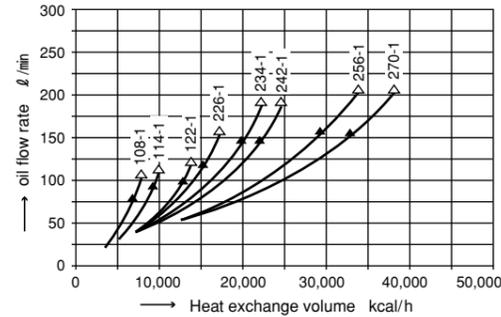

Fluid : ISO-VG46 or equivalent  
 Oil inlet temp. : 55°C  
 Water inlet temp. : 30°C  
 Water flow rate : 1/2 of oil flow (reference table to right)

Model	Water flow	Minimum	Maximum
FTC-6~11-15**	50 l/min	50 l/min	200 l/min
FTC-7~22-20**	80 l/min	80 l/min	360 l/min
FTC-18~44-25**	120 l/min	120 l/min	600 l/min
FTC-31~71-30**	160 l/min	160 l/min	900 l/min

● On the graph, oil side pressure drops at  $\begin{matrix} a \\ b \end{matrix}$  are, a : 0.03 MPa  
 b : 0.1 MPa

● Water flow must be within the limit table above. In cases where 1/2 of oil flow is lower than the minimum limit, use the water flow rate in the table.

● If your specifications differ from graph above, contact Taisei Kogyo.

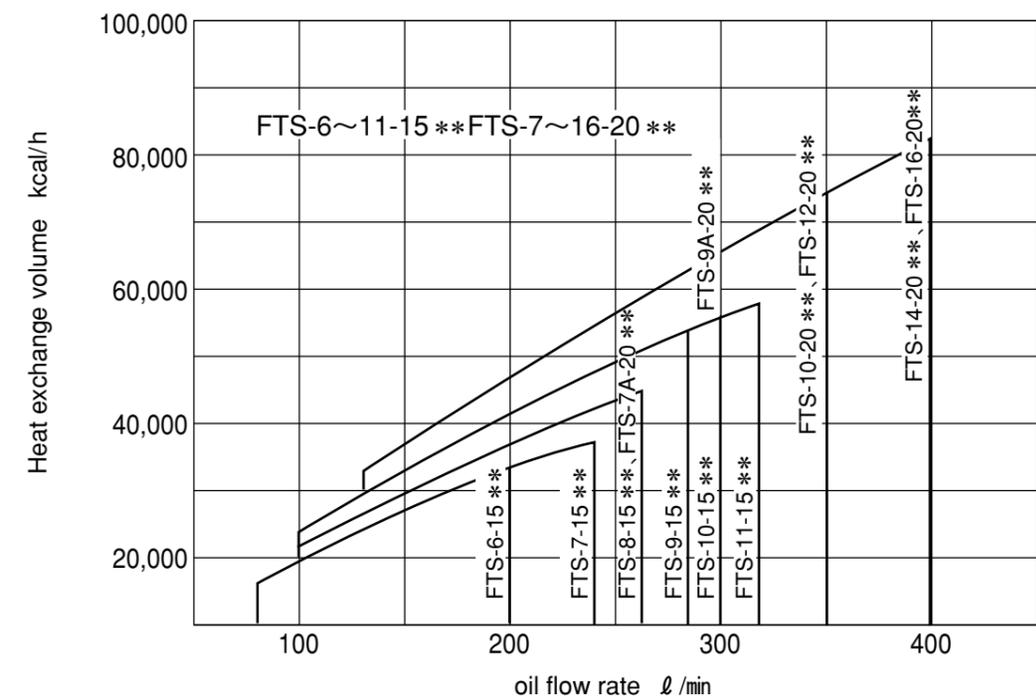

● FTC is a two-pass cooler. If water supply is limited, consider four-pass coolers, FTS.

## ► Cooler selection graph

Condition

Fluid : ISO-VG46 or equivalent  
 Oil inlet temp. : 55°C  
 Water inlet temp. : 30°C  
 Water flow rate : 1/3 of oil flow (reference table to right)

Model	Water flow	Minimum	Maximum
FTS-6~11-15**	30 l/min	30 l/min	100 l/min
FTS-7~22-20**	60 l/min	60 l/min	180 l/min

## Model Number

## Specifications

Type	Fixed tube plate Shell & tube	
Max. operating pressure	Shell side 1.0MPa / Tube side 0.5MPa	
Fluid	Shell side : Mineral based oil, Water Glycol etc. Tube side : Fresh water, Industrial water. (except sea water)	
Tube material	9mm dia. Low fin tube	
Cooling area	0.4~3.5m <sup>2</sup>	
Oil control temp.	Adjustable between 35°C~55°C	
Features	Size	Unique low fin tube allows 20% size and weight reduction
	Leg	U bolt type legs allow free installation
	Corrosion Proof	Inside of chamber cover is coated with a tar-epoxy paint to prevent corrosion.

## ▶ Cooler selection graph

Condition

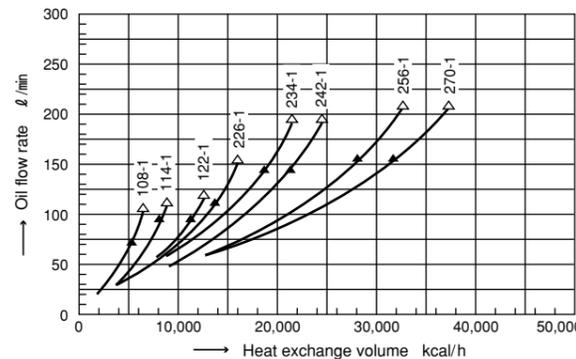

- Fluid : ISO-VG46 or equivalent
- Oil inlet temp. : 55°C
- Water inlet temp. : 30°C
- Water flow rate : 1/2 of oil flow (reference table to right)
- Oil side pressure drop : ▲···0.1MPa
- Water side pressure drop : △···0.15MPa
- drop : 0.01~0.03MPa

Model	Water flow	Minimum	Maximum
FCX-108~122		10 l/min	35 l/min
FCX-226~270		20 l/min	80 l/min

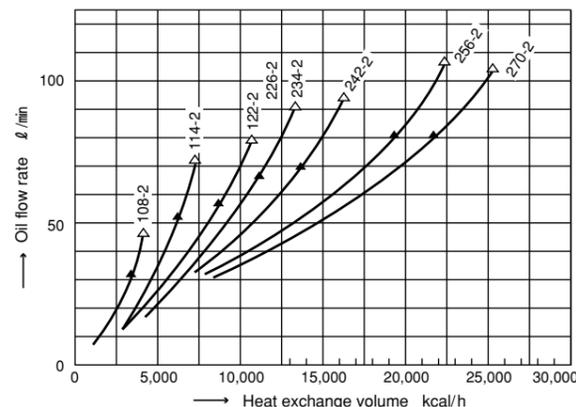

### FCX-108~270-0 type

### FCX-108~270-1 type

### FCX-108~270-2 type

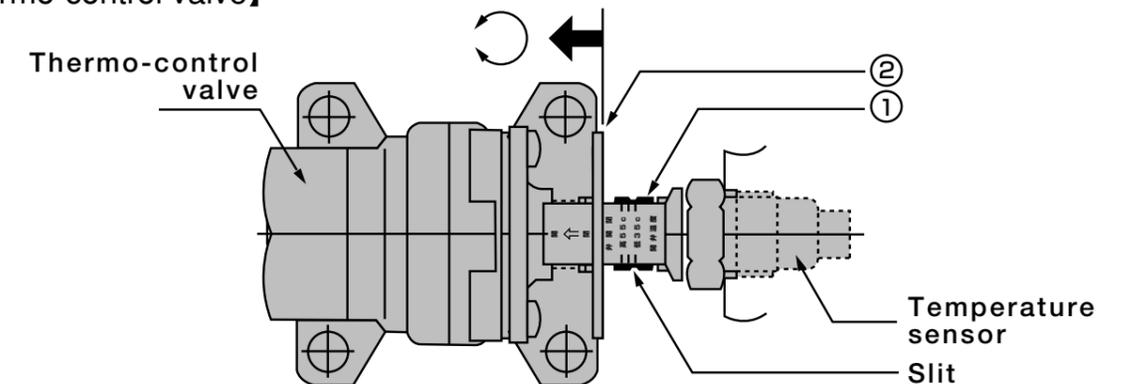

## ▶ Supplementary Items

### 【Cooler Selection】

- This model is a fixed tube plate cooler, so that tube bundle can not be removed.
- Select model number with oil flow and heat exchange volume shown in the graph. If specification is not within the range of graph, consult Taisei for further assistance.
- Consult Taisei if your specification is among these listed conditions:
  - (1) Very high viscosity - for low fin tube, use viscosity below 150 cSt.
  - (2) Cutting fluid, has a tendency to cause rusting.
  - (3) Low quality of water.
  - (4) Fluid is not oil.

### 【thermo-control valve】

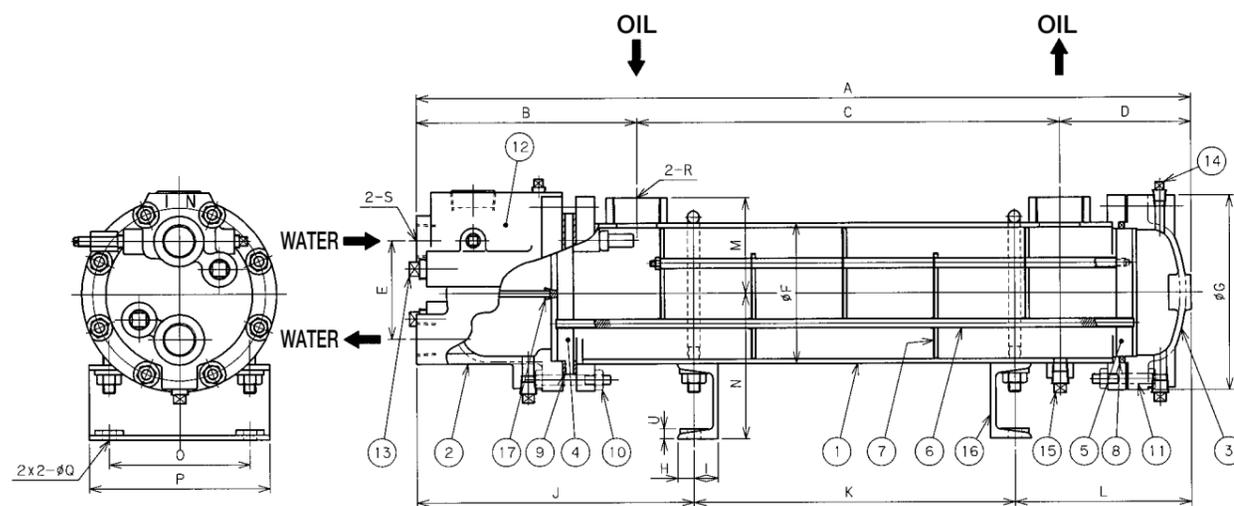

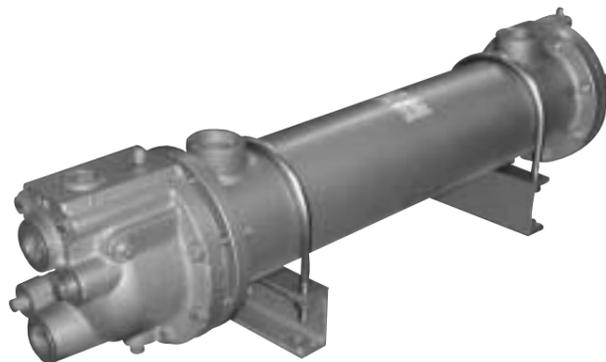

- Adjustable temperature setting  
Set the desired temperature by turning the temperature adjustment ring ① (the factory setting is 35°C).
- If the control valve does not operate  
If the control valve does not operate or requires a setting below 35°C, pull the emergency lever toward the valve, rotate a couple of times and leave it. The valve will open to allow water flow.
- Water leakage  
The standard leakage of the valve seat is less than 30 cc/min with a water supply pressure of 0.15MPa. Please note that this thermo-control valve is not a check valve. Use shut-off valve when the cooler is not in use.

### 【Maintenance】

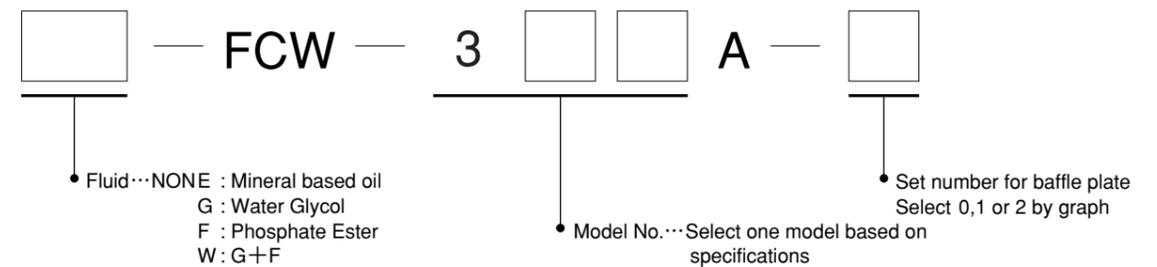

- In winter conditions, drain the cooling water during shutdown periods to avoid freeze fractures.
- Prevent foreign material from entering into the cooling water.
- Clean the cooler every 6 months or at least once a year.
- Thermo-control valve is not a shut-off valve. Small leakage will occur through the valve.  
Shut off main water supply line when the machine is not in use.

	17	Packing	1	12×12×134	NBR

※ FKM Packings are used for fluid "F" and "W" type.

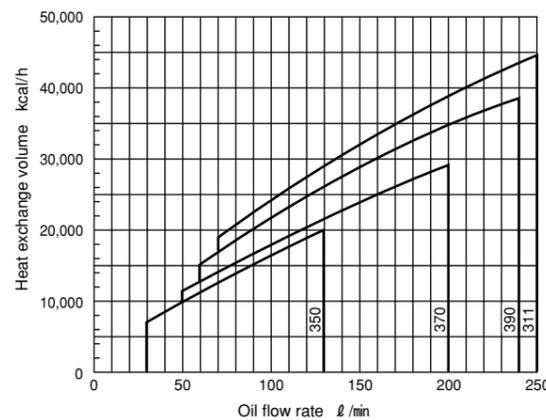

## ▶ Cooler selection graph

### Condition

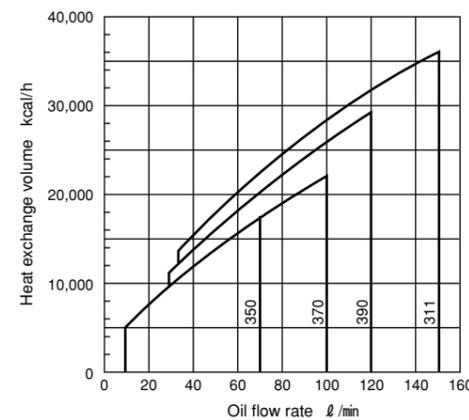

- Fluid : ISO-VG46 or equivalent
- Oil inlet temp. : 55°C
- Water inlet temp. : 30°C
- Water flow rate : Half of oil flow (reference table to right)
- Oil side pressure drop : 0.03~0.1MPa
- Water side pressure drop : 0.01~0.06MPa

Model	Water flow	Minimum	Maximum
FCW-350A~311A		30 ℓ/min	90 ℓ/min

### FCW-350A~311A-1 type

### FCW-350A~311A-2 type

- On the graph, oil side pressure drops at **a** and **b** are, **a** : 0.03 MPa  
**b** : 0.1 MPa

- Water flow must be within the limit table above. In cases where 1/2 of oil flow is lower than the minimum limit, use the water flow rate in the table.
- If your specifications differ from graph above, contact Taisei Kogyo.

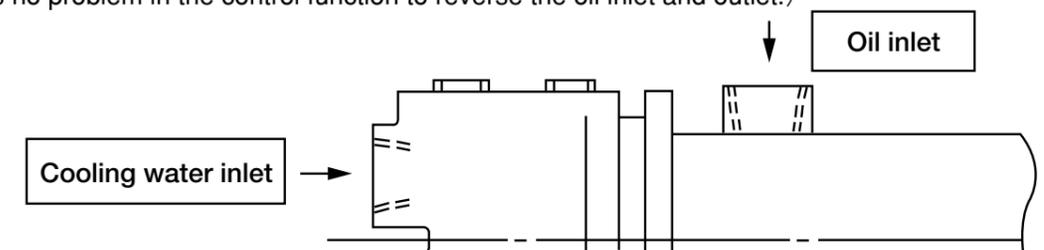

## ▶ Supplementary Items

### 【Cooler selection】

- FCW Model is a floating tube plate cooler, which allows the tube bundle to be removed.
- Select the cooler using the oil flow rate and the heat exchange volume shown in the graph.  
If your specification is not within the range of graph, consult Taisei for further assistance.
- Consult Taisei if your specification is among these listed conditions:
  - (1) Very high viscosity - for low fin tube, use viscosity below 150 cSt.
  - (2) Cutting fluid, has the tendency to cause rusting.
  - (3) Low quality of water.
  - (4) Fluid is not oil.

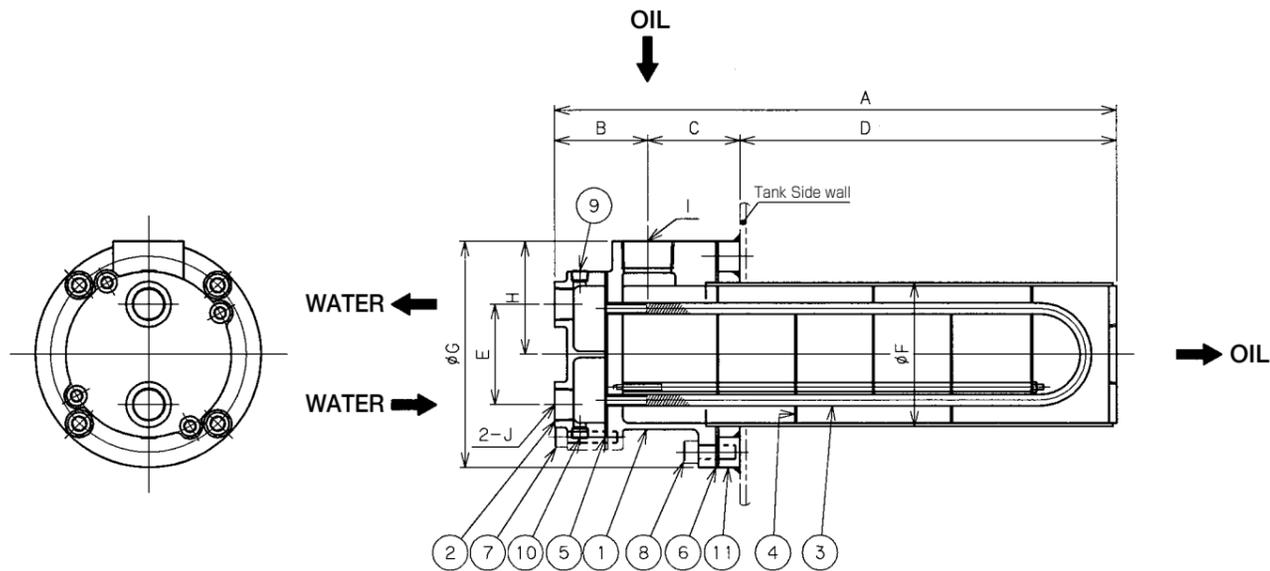

### 【Maintenance】

- In winter conditions, drain the cooling water during shutdown periods to avoid freeze fractures.
- Prevent foreign material from entering the cooling water.
- Clean the cooler every 6 months or at least once a year.
- Cannot adjust oil temperature.
- Maximum operation temperature is 80°C.
- Pressure drop of cooling water is higher than normal.
- There is a flow control valve at inlet port of cooling water, so avoid introducing foreign materials into the valve.  
If foreign material is on the surface of control valve, it will be unable to shut completely.  
To avoid this situation, check the valve seat regularly. Clean the valve seat by removing the blind plug located at the top.
- Cannot change inlet and outlet for both oil and cooling lines.
  - Wrong flow of cooling line—Auto temperature, control function does not work.
  - Wrong oil flow—Thermostatic control oil outlet temperature. Consequently oil temperature increases.  
(It is no problem in the control function to reverse the oil inlet and outlet.)

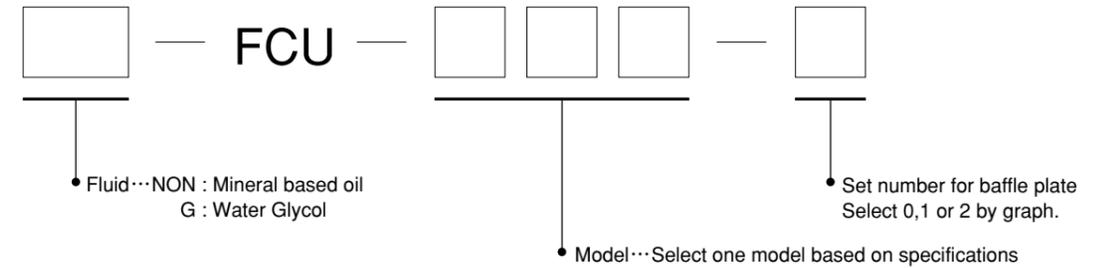

- Cannot use sea water because of corrosion.
- Besides using the auto control function, screw in the manual valve to open, and screw out to close.

### Construction & Dimensions

Code Model	Dimensions										Cooling surface m <sup>2</sup>	Weight kg

# Shell and Tube-type Coolers

To safely use cooler, read cautionary notice and disclaimers.

Before handling this item, read the instruction manual carefully and handle cooler with care.

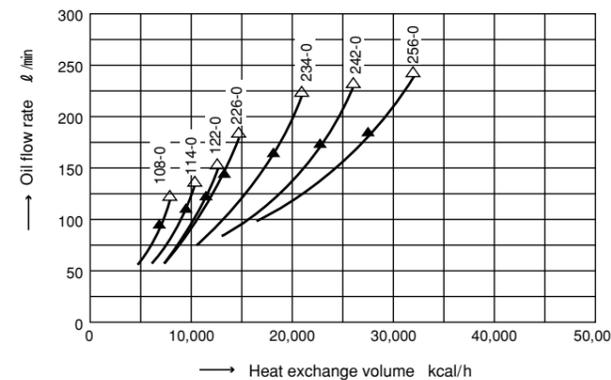

## ► Cooler selection graph

Condition

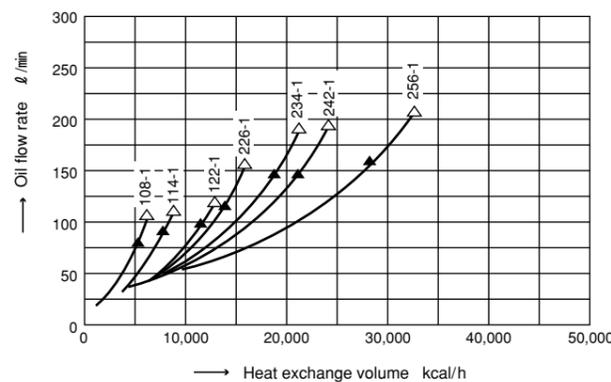

Fluid : ISO-VG46 or equivalent  
 Oil inlet temp. : 55°C  
 Water inlet temp. : 30°C  
 Water flow rate : 1/2 of oil flow (reference table to right)  
 Oil side pressure drop : ▲···0.1MPa △···0.15MPa  
 Water side pressure drop : 0.01~0.03MPa

Model	Water flow	
	Minimum	Maximum
FCU108~122	10 ℓ /min	30 ℓ /min
FCU226~256	15 ℓ /min	55 ℓ /min

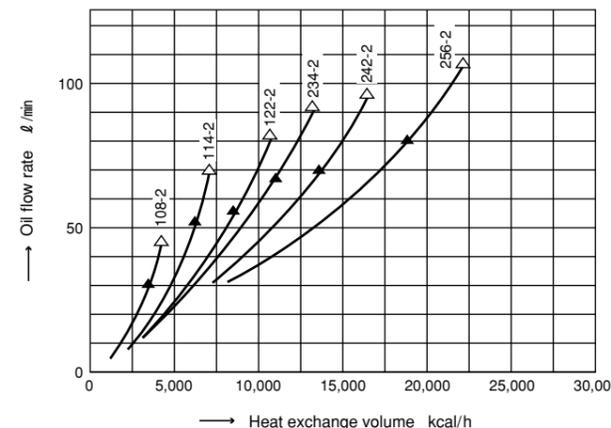

### FCU-108~256-0 type

### FCU-108~256-1 type

### FCU-108~256-2 type

## 1. Warning

⚠ Caution Do not use any other fluids except mineral-based fluids or specified fluids.

⚠ Caution Do not exceed the maximum operating pressure of the cooler.

## 2. Out of Warranty

When coolers are used for applications other than those specified in this brochure, the warranty is not applicable, even if the product is in the warranty period.

### (1) Purpose

- Do not use coolers for unintended purposes
- Examples of unacceptable applications
  - a) Heater
  - b) Beside oil(air, gases and water in shell side)

### (2) Fluids in use

Do not use any other fluids except mineral-based fluids or specified fluids.

### (3) Maximum operating pressure and temperature

Maximum operating pressure—1.0MPa(10kgf/cm<sup>2</sup>)  
 Maximum operating temperature—80°C

### (4) Cooling water

Use fresh water, deep-well water and industrial water to obtain water quality within recommended water quality shown on front page.

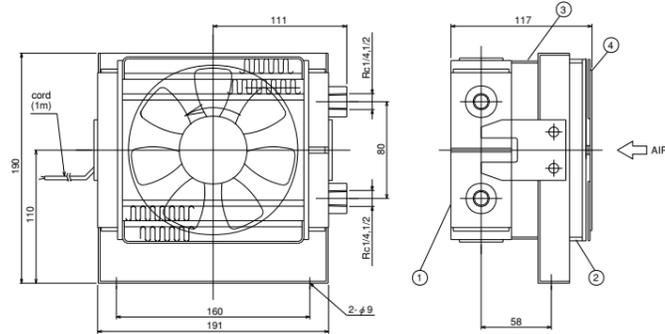

## 3. Maintenance

- (1) In cases of long cooler shutdown periods, drain water from the cooler to avoid corrosion.
- (2) In winter conditions, drain the cooling water during shutdown periods to avoid freeze fractures.
- (3) Prevent foreign material from entering into the cooling water.
- (4) Clean the cooler every 6 months or at least once a year.  
 Change gasket and packing when disassembling the cooler.

V	Attachment for vertical installation	N	Without radiator guard	N	Without fan guard	4	400V
N	Without attachment						

## ▶ Specifications

Model	ATS-3061-M	ATS-3062-M	ATS-3561-M	ATS-3562-M	ATS-4061-M	ATS-4062-M
Fluid	Mineral based oil					
Operating pressure	1.0 MPa					
Rated voltage	3ph 4pin 200V 50/60Hz 3ph 4pin 380-415V 50Hz 3ph 4pin 380-440V 60Hz					
Type of fan	EF-25UTB		EF-30UTB		EF-35UTB	
Power consumption	25W		50W		100W	
Rated current	0.21 / 0.20A		0.33 / 0.29A		0.63 / 0.52A	
Starting current	0.64 / 0.59A		1.1A / 1.0A		2.5 / 2.4A	
Insulation	E grade					
Recommended beaker current (A)	0.28~0.35 50Hz 0.29~0.36 60Hz		0.64~0.80 50Hz 0.55~0.69 60Hz		0.90~1.10 50Hz 0.88~1.10 60Hz	
Sound noise (1.5m beside)	50.0 / 52.0 dB		54.5 / 58.5 dB		60.0 / 63.0 dB	
Ambient condition	Ambient temp. : -10°C~50°C / RH : less than 90% In house use					

\*A rating current is the value for a simple motor.

### ● Thermal protection (only for 200V-type).

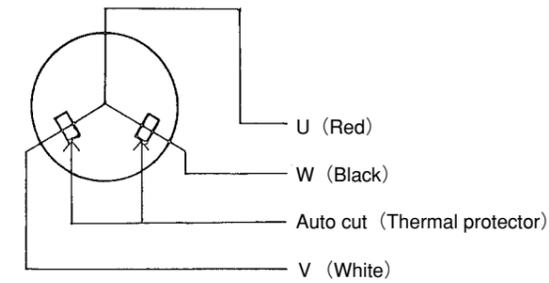

There is a thermal protector in the motor. When the motor overheats, it will stop. After the motor stops, review the procedure below.

- 1) Turn off motor (⚡ do not touch the motor before turning it off) .
- 2) Radiator should not have built up debris on it.
- 3) Look for restrictions in the airflow.
- 4) Check if the electric current is normal.
- 5) Check if ambient temperature is correct or not.

When the temperature cools down, the motor can be used.

⚡ Even if the motor stops but electricity is still supplied, do not touch air cooler.  
(There is a possibility of sudden restart.)

## ● Connection

⚡ The cooler must be correctly grounded to earth.

## ● Accessory

A protective fan guard is provided as an accessory. If you order the fan guard, add "G" at end of the model number.

It is easy to attach the fan guard on the users end even if it is ordered separately.

⚠ TAISEI recommends the use of a fan guard for your safety.

## ▶ Component Parts

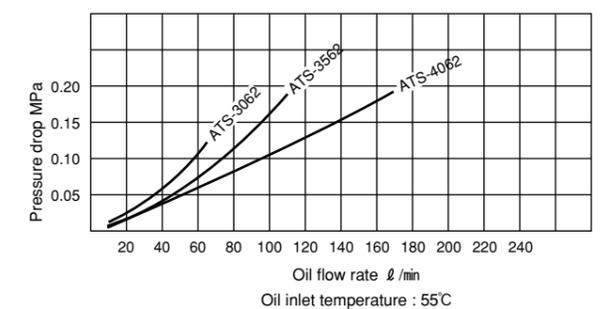

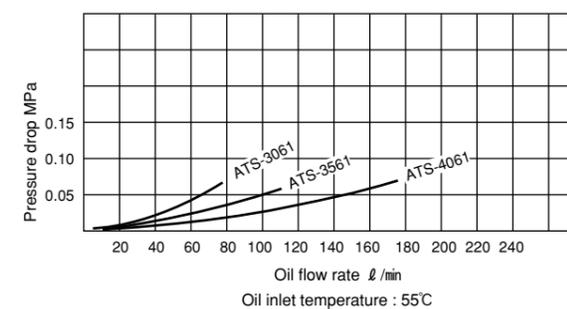

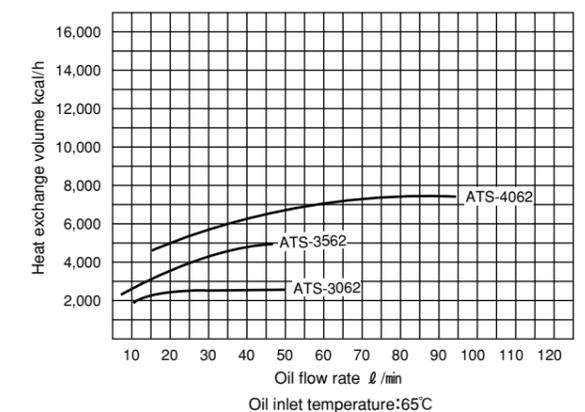

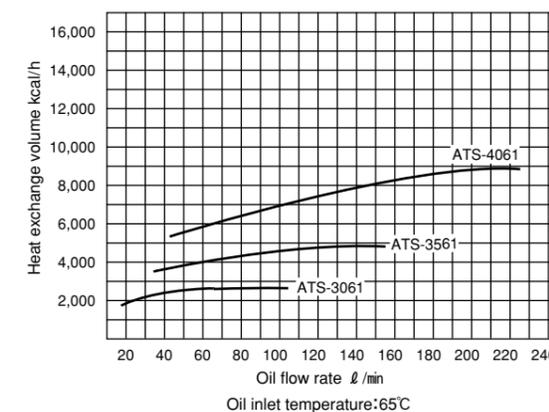

No.	Parts name	No.	Parts name
1	Case	5	Radiator guard
2	Radiator	6	Fan guard
3	Fan motor	7	Bracket
4	Vent		

## ▶ Cooler selection graph

● Taisei will select the best cooler based on the information you provide regarding oil type, oil brand, oil flow, rate of heat exchange, temperature differences, oil pressure drop, power supply (voltage, frequency, type of current) etc.

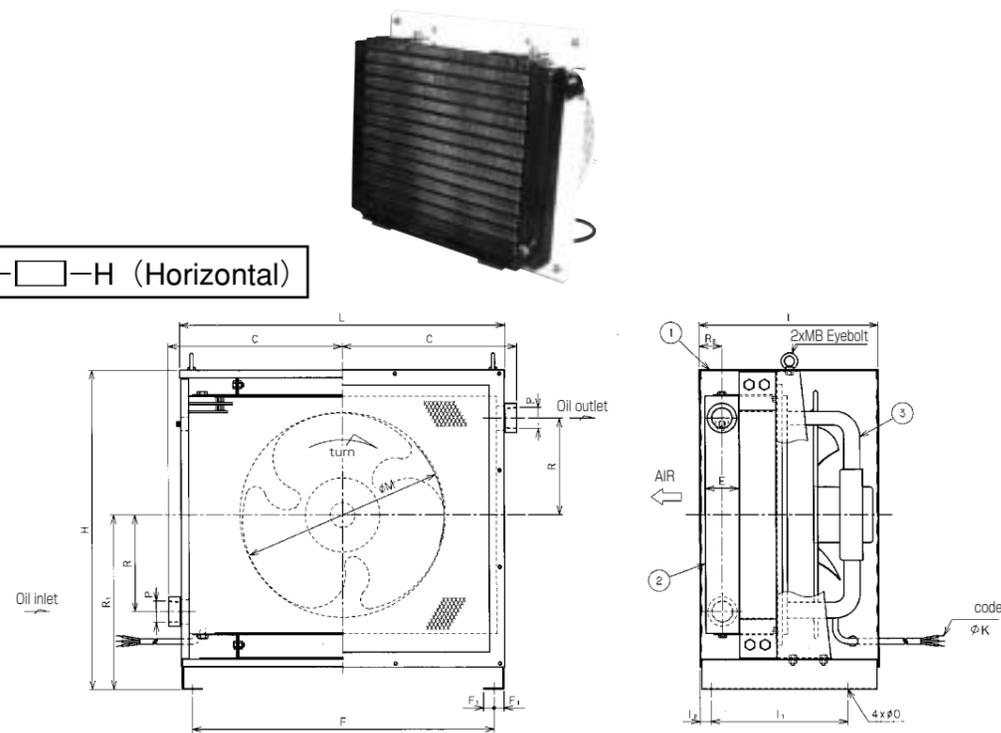

### Condition

Fluid : ISO-VG32 or equivalent  
Ambient temperature : 35°C  
Power supply frequency : 50Hz

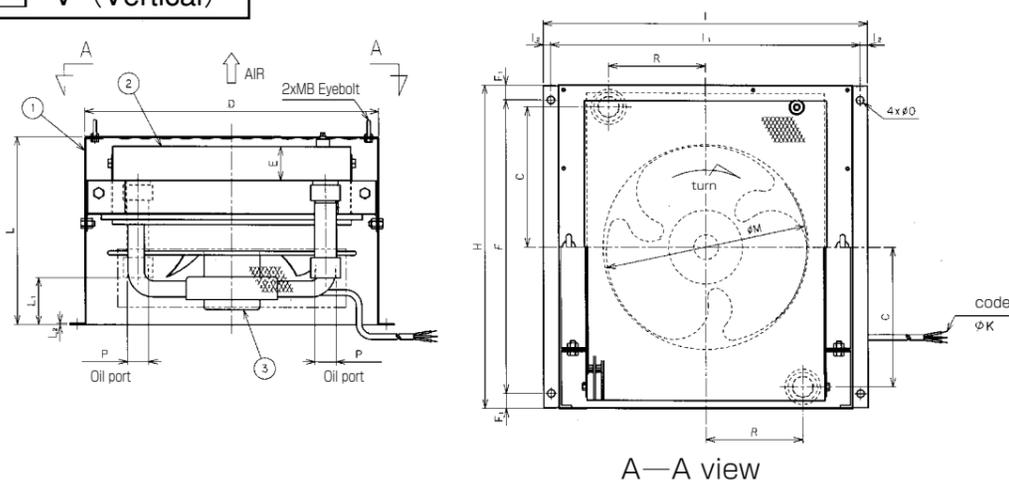

### Construction & dimensions for ATF-H/V (with case)

ATF-□-H (Horizontal)

Code	L	I <sub>1</sub>	I <sub>2</sub>	H	F	F <sub>1</sub>	O	R	R <sub>1</sub>	R <sub>2</sub>	C	E	P	M	K	Weight (kg)

Condition

Fluid : ISO-VG32 or equivalent

Ambient temperature. : 35°C

Power supply frequency : 50Hz

# Air cooled-type oil coolers

To use cooler safely, read cautionary notice and disclaimers. Before handling this item, read the instruction manual carefully and handle cooler with care.

## Warning

	• To avoid either fire and explosion, do not install coolers near flammable powders and explosive gases.
	• To avoid injuries, do not put fingers or foreign materials into the fan motor.
	• If cooler is stopped with the electric power still "on", do not touch cooler because without warning the motor could restart or electric shock may occur.
	• Do not make any modifications. Disassembly and repair is allowed only by authorized personnel.
	• Do not place the cooler in water or spray water onto the cooler. This may cause a short circuit or electrical shock.
	• Install an earth ground to avoid shock.

## Cautions

	• Use only specified electric requirements.
	• Do not install coolers near exposed flames.
	• Do not install coolers in areas where there is a high humidity-more than 90 percent relative humidity.
	• Do not attempt to exceed specified pressure and temperature.
	• Use only mineral-based fluids.
	• Do not attempt to use cooler for other applications.
	• Obtain a fan guard to avoid any injuries.
	• Install cooler on a strong foundation.
	• Shut down electric breaker if cooler will not be used for a long time.
	• Electric wiring is allowed only by authorized personnel.
	• Clean the fan and radiator periodically.
	• Do not block airflow, inlet and outlet.

## 1. Installation

Install a cooler on a solid stand. Provide space for cleaning, inspection and maintenance.

Do not restrict the airflow for best performance.

Monitor the vibration as much as possible. If vibration occurs, use rubber bushings to absorb it.

## 2. Piping

ATF-H.HS.VS(except V-type) provides Rc thread on aluminum base. Use seal tape but do not overtighten as this causes pipe damage.

If there is severe piping vibration, use rubber hose or flexible hose to avoid transmitting vibration to the cooler.

## 3. Operation

After checking for smooth operation, direction of fan rotation and airflow, pour fluid into the cooler slowly.

If the fan rotation is wrong, change the electric wiring.

## 4. Inspection and maintenance

Inspection and cleaning should be performed every 6 months.

It is strongly recommended to clean the cooler before summer because ambient temperatures will be higher.

Electric power must be shutdown before inspecting or maintaining the cooler.

Make sure no pressure remains in the oil line.

## 5. Cleaning

### (1) Radiator outside

Soak radiator in warm water with a mild detergent. After rinsing off the detergent water, use compressed air to dry the radiator.

### (2) Radiator inside

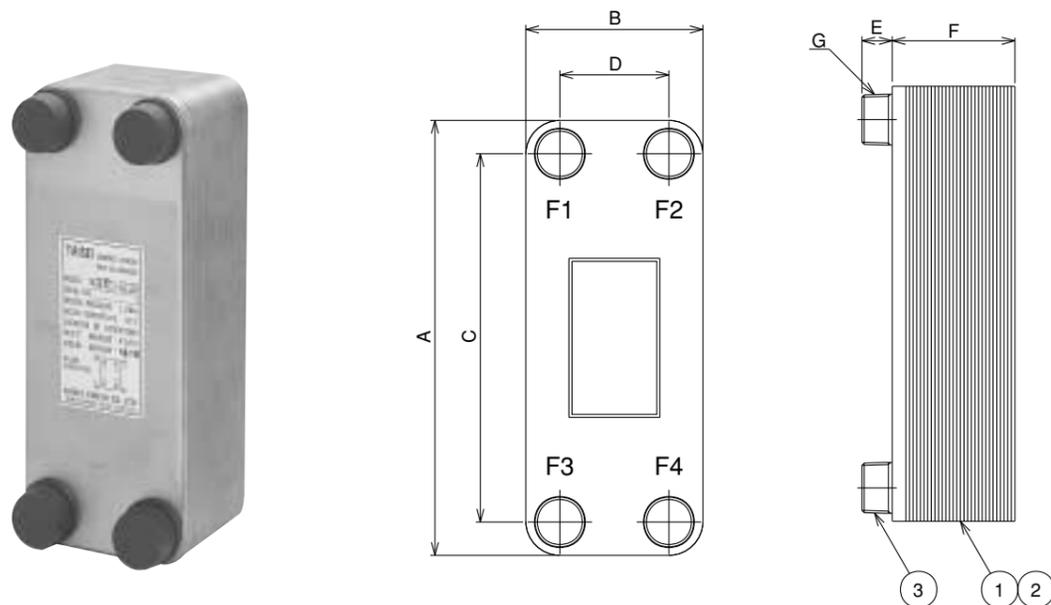

Circulate flushing oil through the radiator and use clean oil to recharge the unit.

It is recommended to clean the inside of radiator once a year.

### (3) Fin of radiator

Make sure the fins are straight. Bent fins may restrict the airflow.

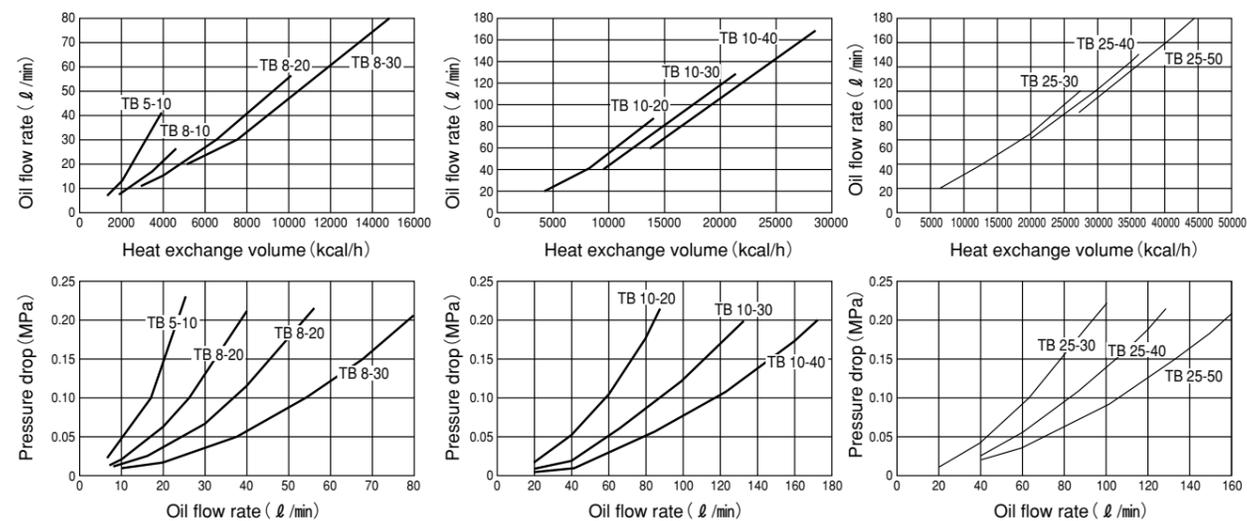

## Profile & Dimensions

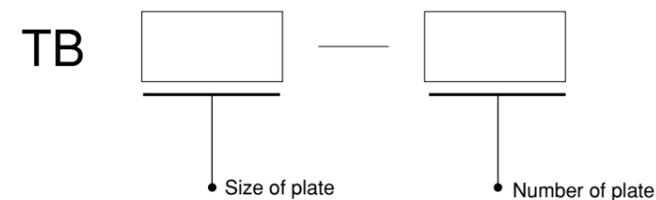

Model	A	B	C	D	E	F	G	Number of plates	Cooling surface (m <sup>2</sup> /sheet)	Capacity (ℓ/channel)	Max. flow rate (ℓ/min)	Weight (kg)

BR25	TB25	587	567	527	115

## 1. PRINCIPAL SPECIFICATIONS

Design pressure : 3.1 MPa

Fatigue pressure rating : 1.5 MPa × 107 times

Design temperature : -195~180°C

Location : Floor mounting; Indoor

## 2. PRODUCT DESCRIPTION

TB compact brazed plate heat exchanger consist of pattern-embossed plate of stainless steel. Every other plate is reversed so the ridges of the herringbone pattern intersect one another on adjacent plates forming a lattice of contact points. When these points are vacuum brazed together a compact and pressure-resistant heat exchanger is formed in which virtually all material is utilized for heat transfer. After brazing, the impressions in the plates form two separate systems of channels where the two media flow counter-current. This complex channel system causes vigorous turbulence, ensuring maximum heat transfer. The result is a highly efficient heat exchanger with heat transfer coefficients having no counterpart.

## 3. INSTALLATION

### (1) Location and ambient conditions:

Location: Indoors, in a location that is dry, relatively dust-free, and safely distant from fires and flammable materials:

Ambient temperature: -195~180°C

### (2) Connect all tubes, making sure that the inlet and outlet connections are made correctly.

(Refer to. [ 8. Nozzle Location])

### (3) Shown below are installing directions.

				
In case of Liquid to liquid applications	Right	Right	Right	Wrong
In case of Condenser / Evaporater	Right	Wrong	Wrong	Wrong

Fig. 1 Installation

- (4) Avoid applying excessive force to the tubes when making connections. If subjected to excessive force, the tubes may break.

Tab.1 Max allowable torque

Model name	Allowable torque(N-m)			
	Assembly conditions		Operating conditions	
	Bending	Twisting	Bending	Twisting
TB5	30	50	20	30
TB8	30	50	20	30
TB10	50	150	40	90
TB25	50	150	40	90

- (5) Ensure that there is sufficient space around the Heat exchanger for maintenance.  
 (6) This heat exchanger has no air vent ports and drain port.

If necessary, Please set up it on the connections.

※ We have the brackets for mounting. (Refer to attached drawing.)

## 4. NOZZLE LOCATION

### (1) Liquid to Liquid applications ( non-refrigerant)

The circuit with the highest temperature and / or pressure should be connected to the left side of the heat exchanger when the arrow is pointing upwards. In most cases the two medias are connected in counter current, e. g. primary media inlet at port F1 and outlet at port F3, and the secondary media Inlet at port F4 and outlet at port F2.

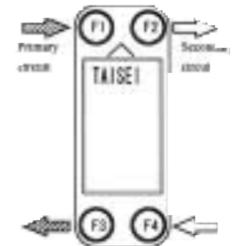

Fig. 3 Connection location: Liquid / liquid applications

### (2) Condenser

In case of Condenser, TB Should be mounted the vertical position with the arrow on the front plate pointing upward. The refrigerant(gas) is connected to the upper left connection and the condensate to the lower left connection. The water / brine circuit inlet is connected to the lower right connection and the outlet to the upper right connection.

※ TB used as condenser, we recommend the one with soldering connections on the refrigerant side.

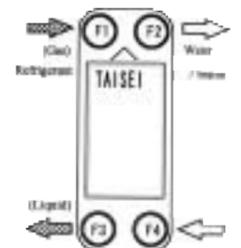

Fig. 4 Connection location: Condenser

### (3) Evaporater

In case of Evaporater, TB Should be mounted the vertical position with the arrow on the front plate pointing upward. The refrigerant(liquid) is connected to the lower left connection and the gas to the upper left connection. The water / brine circuit inlet is connected to the upper right connection and the outlet to the lower right connections.

※ TB used as evaporater, we recommend the one with soldering connections on the refrigerant side.

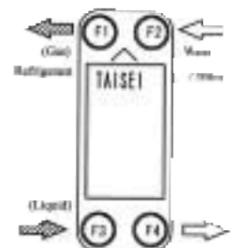

Fig. 4 Connection location: Evaporater

### ※ Soldering connections

All TB's are vacuum brazed with copper. This means that in no way the temperature may reach over 800°C under normal soldering conditions(no vacuum), because then the copper solder would change it's structure and result would be internal or external leakage at the connections.
