REFRIGERATION DRYERS

About us

Ing. Enea Mattei SpA is an Italian company that has been producing air compressors since 1919. Over the years, the company has continually evolved and is today one of the world's foremost companies in the compressed air sector and the leader in the production of rotary vane compressors.

Behind the success of Mattei are the choice the company has made in terms of design, production and marketing, driven by the results of its continual and in-depth research and development programmes.

During these years of continual change, Mattei has been able to adapt to the requirements of the market and through the results of its research has created products that are always innovative and technologically advanced.

Certified quality

Quality as an integral part of all company functions and constant improvement of all production processes so as to always guarantee the maximum level of reliability and satisfaction. This, in brief, is the value and the meaning of Mattei's operational philosophy. A way of approaching the market and customers that makes Mattei an absolute point of reference in the compressed

Since 1994, Mattei has been operating with a Quality System certified by the DNV Institute under UNI EN ISO 9001 regulations.

MD refrigerant dryers

Compressed air is used in industrial productive processes, as it is a clean and convenient energy source.

However, to optimise the efficiency of the system, this important resource needs to be properly treated to assure

top efficiency. The ambient air intaken by a compressor always contains the water vapour, the value of which depends on the temperature and the relative humidity degree.

When the air is compressed, the volume decreases proportionally but all the exhausted water vapour still remains in the air. Condensate corrodes piping, solenoid valve, pneumatic tooling and the user is then obliged to stand expensive repair interventions; especially the expensive "down times" cannot be controlled very easily.

In case the compressed air is used as "process air" **the installation of a Mattei dryer** is essential to eliminate the condensate polluting the production cycle.

ELECTRICAL ENERGY SAVING: a reduced pressure drop through the dryer has a direct effect on reducing the running costs of the compressed air system of between 5 and 8%.

CONTROL PANEL: guarantee consistent performance also in intermittent working conditions.

CONDENSER: ensures maximum performance of the refrigerant circuit and the ability to operate with changes in the ambient conditions.

ALU-DRY MODULE: has a direct effect on reducing energy consumption.

CONDENSATE DRAIN: adjustable electronic condensate drain with timer.

INTEGRATED "HOT GAS" BY-PASS VALVE

prevents the formation of ice inside the evaporator.

Definite avant	R134a up to MD25 model						
Refrigerant	R407C from MD38 model						
Compressed Air Inlet Temperature	+35°C						
Working Pressure	7 bar						
Maximum Working Pressure	14 bar						
Pressure Dewpoint	+3°C						
Protection Index	IP 22						

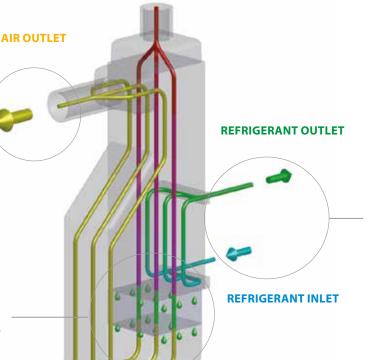

AIR-TO-AIR HEAT EXCHANGER:

The counter flows of compressed air in the air-to-air heat exchanger ensure maximum heat transfer.

The high efficiency condensate separator is located inside the heat exchanger module. No maintenance is required and the coalescing effect results in a high degree of moisture separation. The large capacity separator is designed to hold condensate also with high humidity in compressed inlet air.

AIR-TO-REFRIGERANT HEAT EXCHANGER:

The generous dimensions of the airto-refrigerant plus the counter flow gas streams allow full and complete evaporation of the refrigerant (preventing liquid returning to the compressor).

The large cross section of channels within the heat exchanger module leads to low velocities and reduced power requirements.

Environment protection

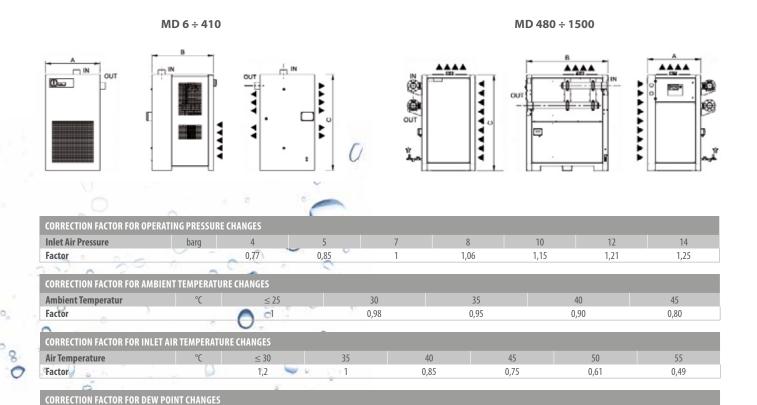

MD dryers use only very efficient and environmentfriendly gases according to the existing regulations and to the laws in force. R134a refrigerant for MD 6-25 series and R404A refrigerant for MD 38-810 series.
